Demo day

One decision each, judged on process. The door, the kit, and the course's own retrospective.

We grade decisions, not outcomes.

Education, not advice.

0:00 — THE DOOR

Your email is the key now.

What you see

The course address asks for your email, sends a one-time code, lets you in. Only the enrolled addresses are on the list: a friend with the address gets the door and no further.

Your page

/me — the site finds your paper account by the email you signed in with. The old /tickets/<code> address still works, for you and the tutor only. Everything else is where it was.

What the toolkit does with it

Matches the email to your row. Nothing else: no password stored, no code seen — the sign-in is Cloudflare's. The code is still how the tutor refers to an account.

The syllabus's exit check for the phase, shown live: the Access policy admits only enrolled emails.

0:10 — DEMO DAY

Five questions. The sixth is not asked.

	The question	A full answer has	It never has
1	What did the rule say?	The state on the close you acted on, since when, the signal's own date	"I had a feeling"
2	How many, and why?	The calculator's number — the risk, the value, the target — and what you took (fewer allowed, never more)	A round number for comfort
3	Where was the stop, and what was the plan?	The level, that it trails, and "if it is hit I close on the next close"	A stop moved down
4	What did you write down, and when?	The entry before — trigger, thesis, what would prove you wrong, size, review date — and the entry after	A journal written to fit the result
5	Did you do what you wrote?	The audit's line; the close ticket within the week, or nothing done because nothing was due	"I was going to, but it bounced"

The sixth question — did it go up? — is luck's. A presenter who answers it is thanked and asked question five again.

One question each, on process.

The good questions

What was the instrument risk that night? · Why 17 shares and not 18? · What would have proved you wrong? · When the stop was hit, what was the first thing you did?

The question not asked

Anything about what the price did. A question about the result is a question about luck, and the course has nothing to say about luck.

The grade

Three sentences from three people — one thing the process did well, one thing the journal could have carried, one thing the room learned — written under the entry. The same grade a nightly report gives.

The best question of the evening is the one that makes the presenter open their journal to check.

0:35 — SECOND HALF

Wrong by the rules beats right by luck.

Closed on the stop

The audit says Followed: the stop hit, the ticket written within the week. The journal says what was done and when. The price is not on the sheet and not in the grade.

Still open, never tested

The audit says Followed: opened with the rule long, the stop trailing. Nothing has asked anything of this student yet — question five is whether they would.

Not followed

The best four minutes of the evening. The question is what the journal says about it and what was done after — not whether it cost anything.

The student who wrote no ticket presents the decision not to: the rule flat all term, the journal's "waiting" lines — and whether they waited by the rules.

The course, judged by its own rubric.

	The question	The course's answer, to be questioned
1	What did the rules say?	Graham for what, Carver's Starter System for when and how much — written into a toolkit that enforces them. Where a human was still needed: the quarantine, the unknown split, the unlinked account.
2	How much, and why?	Paper money only, $10,000 a head, a 12% risk target. Did the size make the lessons real?
3	Where was the stop?	The checks: the explainer's and the tutor's grounding, the review's withheld readings, an independent review before every shipment, a live check after. What they caught; what slipped through — named in the record.
4	What was written down?	The build log, the decisions, the register, the record of live checks — all public. Could a stranger follow it? Could a student?
5	Did the course do what it wrote?	Twelve features, twelve lessons. The register says which were built, which verified live, which are still open — read the open ones aloud.

A course that ends with an honest list of what it did not finish has followed its own rules.

What the checks caught, by name.

Week 8: the code on the page

A test account's code printed in the page's lede; a screenshot leaked the page's only key. Kept as lesson 8's exhibit (OI-56). Now the email is the key and the lede says who is signed in.

Week 11: the stale seed

The tutor's notes were generated before the last two file edits. The independent reviewer caught it; a test now fails the suite if it ever happens again (review F2).

Week 11: "is well"

The first live rejection of a reading was a false positive — an adverb caught by an outcome pattern. The record has it; the pattern was narrowed; the withheld reading is now kept on its row to be read.

Opacity is where the fee-takers live. A course that hid its register would be asking for the trust it told the room never to give.

Seven documents; two to print.

	Document	From	What it is for
1	Student quickstart	week 1, kept current	What you need, how the site grows, how to sign in and find your page, why the code is public
2	The decision journal (print)	week 1	The template every entry follows: trigger, thesis, what would prove you wrong, size and why, review date
3	The Starter System rules card (print)	weeks 7–9	The seven rules the toolkit enforces, one page
4	The reading list	week 1, grown	Graham, Carver, Peacock — what each is for, which chapters
5	Costs and tax — the walkthrough	week 11	A broker's mechanics and the Irish costs and tax, every figure dated, the Bill marked as a Bill
6	Scam-spotting notes	weeks 6 and 11	Stories versus numbers; the platform itself — the register, the number, the fee page, the exit
7	Demo day — the rubric and the retrospective	week 12	Tonight's five questions, and the course's own

The toolkit stays up behind the door for as long as the tutor says tonight. Every line of it is in the open repository, with a README written for a stranger.

1:15 — AFTER

The course ends. The routine does not.

Monday evening

Open your page. Read the stop line first. Read the rule's state. Read the report's sentence. Write the Monday line in the journal.

Once a week

The review page: the audit's lines, and a reading if you want one — check its tags against the sheet, as you did with the tutor.

Once a year

The costs-and-tax page against that year's Finance Act: this autumn's Bill is expected to become an Act in December — a Bill until it does — and the page says the date it was checked.

What (Graham), when and how much (Carver), how to check (the tutor), what it costs and what you keep (the real world). None of it changes the rules.

1:25 — CLOSE

The three promises, read by three students.

Paper portfolios only

Nobody risked a cent in this room. Twelve weeks, every account on paper, every cost line a real cost in a paper trade.

No tips, ever

You leave with a process, not a portfolio. The toolkit refused to say what to buy, and so did its tutor, and so did its review.

Everything is open

Every tool was built in public: every rule, every figure, every check, every fault in the register. Tagged v1.0 tonight.

Then the sentence, one last time, by the room: we grade decisions, not outcomes.
